## **Linguistic, Logical and Rethorical Problems in Natural LanguageTexts: A Classification**

**Prof. ROBERTO GARIGLIANO**

**Wednesday 13 June 2007**

**4 PM Disa Seminar room**

**Facoltà di Economia – Via Inama 5**

Documents which form the basis of company policy or strategy, of government policy or of economic theory and analysis are often written using natural language (e.g. everyday English augmented by relevant technical jargon). It follows that problems related to the use of natural language can afflict such texts, reducing their meaningfulness, correctness or understandability. In this seminar a classification of such problems is presented with examples of each type. This is part of ongoing work at DISA, researching the impact of natural language on economic documents and the way in which better use of natural language in this context can be fostered.
